

Volunteers needed for an important research study on concussion and vision.

Who can participate?

Active-duty military personnel 17 (if emancipated) to 40 years old, including military academy cadets/midshipmen

Concussed Group

- Diagnosis of a concussion, 0 - 180 days post-injury
- Currently experiencing persistent concussion symptoms

Control Group

- No history of a concussion in past year
- No history of vision therapy

What is this study about?

Mild TBIs, also known as concussions, can affect the safety and readiness of service members and veterans. The changes in vision after a concussion can sometimes be very subtle but at the same time severely affect a person's ability to perform vision-driven tasks. This study will determine the frequency of these vision problems after a concussion. The study will compare the frequency of these vision problems in people with a history of concussion vs. people without a history of concussion.

What is involved in the study?

A comprehensive, dilated vision examination that is approximately 1-hour in length.

**If you would like to participate
or have questions about the study, please contact:**
